                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                      The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic signalling proteins (beta-ASP) which increase traceptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present CDNA sequence encodes human partial cardiac adenylcyclase VI (ACVI) isoform which is used for exemplification

from the present invention. The present invention describes a recombinant replication-defective viral particle (I) comprising a gene encoding a beta-adranegic signalling protein (beta-ASP) operably inked to a promoter. Also described are: (I) a recombinant pro-viral plasmid (Ia) comprising a gene encoding a beta-ASP, as above, operably linked to a promoter and further comprising a replication-defective viral genome; (2) a (mammalian) cell transfected with (I) or (Ia); an isolated polynucleotide comprising a sequence encoding a human adenyllycyclase isoform VI (AC-VI), or a variant having Ac activity; (4) a human AC-VI encoded by (3); (5) an isolated polynucleotide comprising the polynucleotide of (3); (1) can be used to form a comprising the polynucleotide of (3). (I) can be used to form a cardiac function in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAACGCAATGGGCAGAAGCGTTCGCGGCGCCGTGGCACTCGGGCAGGTGGCTTCTGCACG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification

     to methods and compositions for enhancing
The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inscrting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian heart failure. The present DNR sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating a fourth beta-ASP transgene, used in the exemplification

The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present colns sequence encodes human modified cardiac adenylcyclase VI (ACVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       141

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A canine heart cDNA library was constructed in lambda gt10 and was screened with a 970 bp AatI-HincII fragment from type I adenylyl cyclase cDNA probe (encodes the first cytoplasmic domain of adenylyl cyclase, which has significant homology to other previously known types of adenylyl cyclase). One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into pUCIB and further subcloned and sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete canine cardiac adenylyl cyclase gene. The gene is suspected of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 ATGTCATGGTTTAGTGGCCTCCTGGTCCCTAAAGTGGATGAACGGAAAACAGCCTGGGGT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW3059) that is expressed mainly in the heart and brain. AAC6 has a similar putative structure to other adenylyl cyclase isoforms but, like type V, is distinguishable in that it has a larger.

N-terminus and a relatively shorter C-terminus as it larges the C2b region. AAC6 CDNA was initially isolated from a human heart CDNA region. AAC6 CDNA was initially isolated from a human heart CDNA region. PAC6 CDNA was initially isolated from a human heart CDNA region. PAC6 CDNA was initially isolated from a human heart CDNA region. PAC6 CDNA sequence. The invention relates to the hAC6 compand to profited AAC6 and the full-length CDNA sequence. The invention relates to the hAC6 compand to profited AAC6 and the proteins made by these methods, antibodies against hAC6. Sene, methods for the recombinant production of purified AAC6 and the proteins made by these methods, antibodies against hAC6 correctors, probes and host cells (especially HEK-293) transformed by diagnostic and therapeutic uses for these various reagents. hAC6 can be used as a tool to screen for agonists and antagonists that in treating diseases caused by aberrant activity of this enzyme, and diseases whose symptoms can be ameliorated by stimulating or inhibiting the activity of hAC6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 GAACGCAATGGGCAGAAGCGTTCGCGGCGCCGTGGCACTCGGGCAGGTGGCTTCTGCACG 120

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199102 to AB19912, encoding the protein sequences in ABB57020 to ABB5714) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

```
A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase C.l and C.2 domains linked covalently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl cyclase, is activated by Gsalpha

```
The invention relates to nucleic acids from human chromosome 2p21-16.3
and the encoded peptide (and mouse and chicken orthologues) that
comprises a PGECCPLP group, an insulin-like growth factor binding protein
(IGFBP)-like domain, cysteine-rich domains, an RGD (undefined) group
and a transmembrane domain. The protein, e.g. CRIMI, interacts with
peptides of the transforming growth factor superfamily. A composition
comprising an expression construct comprising the nucleic acids of the
invention or a mimetic which antagonises or mimics an activity of a CRIMI
conprising any be used in a method for modulating the biological
activity of a polypeptide of the bone morphogenic protein (BMP) family.
In this way they may be used to prevent or treat an eye disease,
contracted formation. They may also be used to treat
contracted activity diseases, renal amange, e.g. by use of the nucleic acid in
abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in
activity contracted formation. They may also be used to treat
abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in
activity contracted products and skin damage, e.g. by use of the nucleic acid in
activity contracted against CRIMI polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Db 234445 CCCTACGCCGCAGCTCCTCCTCCTCCTCCTCCGCCGGACGCGGAAGTCCCCGCC 234386

The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis,
                                                                                                                                                                                                                                                                           cytostatic; hepatotropic; nootropic; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary;
Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -

       The nucleotide sequence of the novel N-methyl-D-aspartate (NMDA)

receptor 2C (NMDAR2C) gene clone NMDA24. This clone covers bases

861-4068 of the complete NMDAR2C gene (AAQ79372) with an insertion of 11

bp between bases 1300-1 and an insertion of 24 bp between bases 2350-1.

The 11 bp insert adds an extra 3 a. to the peptide sequence but causes

a reading frame shift which terminates the peptide at residue 494 of the

NMDAR2C sequence. The NMDA receptor contains two subunits R1

(AAQ79370) and subunit R2 selected from the subunits 2A (AAQ79375), 2B

(AAQ79377), 2C and 2D (AAQ79378). The receptor forms part of a family of

NMDA receptors which have cation-selective channels and bind quitamate

and NMDA. The NMDAR2C gene was obtained by amplifying cDNA derived from

human brain tissues with primers corresponding to sequences in the rat

NMDAR2A receptor DNA and using the resultant fragments as probes to

screen a cDNA library derived from human hippocampal RNA. 4 basic clones

were isolated: NMDA21 (AAQ79399), NMDA22 (AAQ79400), NMDA24 (AAQ79401)

and NMDA26 (AAQ79402). The clones are thought to be splice variants of

each other. Based on the sequence of the 4 clones, a series of variants

(AAQ79403-7) of the NMDAR2C receptor were constructed. The expression of

the genes allows the reconstruction of the NMDA receptor. The complete

receptor can be used to identify compounds which bind or are antagonistic
                                                                                                                                                                                                                                                                                                                                                                                               ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel; glutamate; hippocampus; rat; pcDNA1; NMDA receptor; antagonist; ds.

The including sequence of the movel of the coperate (NMDARZC) gene clone (AAQ/9372) with an insertion of 11 pp between bases 1300-1 and a 15 bp deletion of bases 1960-74. The 11 bp insert adds an extra 3 a.a. to the peptide at residue 494 of the NWDARZC frame shift which terminates the peptide at residue 494 of the NWDARZC sequence. The NWDA receptor contains two subunits: subunit R1 (AAQ/9370) and subunit R2 selected from the subunits 2A (AAQ/9375), 2B (AAQ/9377), 2 c and 2D (AAQ/9378). The receptor forms part of a family of NWDA receptors which have cation selective channels and bind glutamate and NWDA. The NWDARZC gene was obtained by amplifying cDNA derived from human brain tissues with primers corresponding to sequences in the rat NWDARZA receptor DNA and using the resultant fragments as probes to soreen a cDNA library derived from human hippocampal RNA. 4 basic clones were isolated: NWDA21 (AAQ/9399), NWDA22 (AAQ/9400), NWDA24 (AAQ/9401) and NWDA26 (AAQ/9402). The clones are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants (AAQ/9403-7) of the NWDARZC receptor where constructed The expression of the burnar when we have constructed are expression of the burnar when we have constructed the expression of the burnar when we have a complete the technique of the NWDA receptor. The nucleotide sequence of the novel N-methyl-D-aspartate (NWDA)
receptor 2C (NWDAR2C) gene clone NWDAR2C-delta15-delta51. This clone
contains bases 1-1959, 1975-2350 and 2402-4068 of the complete NWDAR2C
sequence (AAQ79372). The variant differsifrom the full length sequence by
a 15 bp deletion of bases 1960-74 and a 51 bp deletion of bases
2351-2401. A series of variants (AAQ79403-7) of the NWDAR2C receptor
were constructed, by recombination, based on the sequence of the 4 basic
clones: NWDA21 (AAQ79399), NWDA22 (AAQ79400), NWDA24 (AAQ79401) and
NWDA2 (AAQ79370) and subunit R2 selected from the subunits 2A (AAQ79375), 2B
(AAQ79377), 2C and 2D (AAQ79378). The receptor forms part of a family of
NWDA receptors which have cation-selective channels and bind glutamate
and NWDA receptor. The complete receptor can be used to identify compounds
which bind or are antagonistic to the human NWDA receptor.
                                                                                                                                                      N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel; glutamate; hippocampus; rat; pcDNAl; NMDA receptor; antagonist; ds.
                                                                                                                                                                                                                                               /*tag= a
/product= NMDAR2C-delta15-delta51 receptor subunit

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequencing vector: M13; 100%
